

Global NGO Deworming Inventory

Summary Report: Number of School-age Children Treated by Country

Key:

- A Region:** Geographic region as defined by WHO.
- B Country:** Country in which deworming activities were reported.
- C Total SAC population:** The total school-age population (children 5-14 years old) at risk of infection with soil-transmitted helminths. Source: WHO Preventive Chemotherapy Databank (PCT).
- D Total school-age children treated:** The total number of school-age children that received deworming drugs in 2009, by country. This number reflects the sum of treatment achievements of multiple NGOs working in the same country, as reported to the Inventory. The aggregate number has been adjusted, where possible, to avoid double counting between NGOs that collaborate in deworming activities. Deworming drugs include mebendazole, albendazole (alone or in combination with ivermectin), or praziquantel. **NOTE:** some treatment figures may include other age groups treated (under 5 year olds, adults).
- E Total additional drugs provided:** In some cases, organizations reported the number of deworming drugs that were provided to a country, not the number of children treated. The number of additional drugs provided is the number of deworming drugs provided to the country in addition to the drugs that were ingested by children as reported in column D. We do not have reports on how many of these drugs were used to treat school-age children.
- F Reporting organization/source:** Organization that submitted the treatment report to the Inventory. Reporting organization may have distributed drugs to children or partnered with an implementing partner to distribute the drugs. In the case where the Reporting Organization is listed as "other", the information from these 'other' organizations has not yet been verified.
- G Implementing partners:** Organization that distributed the drugs to children in country. In some cases, the implementing partner is not specified. Only information on the Reporting Organization is available.

NOTES:

Please note that although the treatment figures have been reviewed and cleaned to the extent possible, there may be some inconsistency in the data presented.

- in some cases, treatment figures have not been disaggregated across different treatment rounds. Therefore, in some cases treatment numbers may be an overestimate as they sum up the total number of treatments across multiple treatment rounds instead of distinguishing the number of children treated by treatment round.
- there may be some double counting between organizations donating/procuring the drug and organizations distributing the drug to at-risk populations.

The report may be updated as corrections/clarifications are received.
